FRA Diagnostic Report

Generated: 2026-03-28 15:39:22

Field	Value
Fault assessment	Winding Deformation
Confidence (0–100)	44.9
Severity	High
Anomaly score (0–100)	100.0
Correlation (vs ref)	0.1694
Max deviation	20.28 dB

Recommendation

Significant deviation detected in mid-frequency range (10kHz–100kHz) suggesting axial winding displacement. Schedule internal inspection within 30 days. Reduce loading to 80% capacity until inspection is completed. Expert notes: Low-frequency energy deviation → possible core or clamping issue; Broadband magnitude deviation vs reference

Explanation

ML classifier: Winding Deformation (73% estimated class confidence). Statistical correlation vs reference: 0.225. IsolationForest anomaly score (0–100, higher=worse): 100.0. Rules: Low-frequency energy deviation → possible core or clamping issue | Broadband magnitude deviation vs reference
